

Democratizing access to modern electronic markets.

Protocols are normalized as intermediate binary representations, then compiled into `Wireshark dissectors`, `C structs`, `C# packed structs`, and `Java classes`. One model, every venue, every language.

Directory

The catalogue

A curated index of public protocol specifications, sample data, and reference material. These are collected from publicly available sources and preserved so the historical record survives even when exchanges retire or rename their feeds.

Technology

The OMI compiler

Two stages. First, a venue's published specification is normalized into a universal binary protocol model. This is a canonical intermediate representation independent of any specific output language. Second, the compiler consumes that model and emits target-language artifacts.

Framework · Published Patent Filings

US20240422245A1	Universal binary specification model	W. Tegel · pub. 2024-12-19	PDF
US20240419416A1	Binary data model compiler	W. Tegel, pub. 2024-12-19	PDF
WO2026050010A1	Binary data model compiler (international)	W. Tegel, pub. 2026-03-05	

Principles

Philosophy

OMI is market-neutral. We do not take sides between exchanges, brokers, trading firms, or technology providers. We do hold positions on two things:

01 Transparency

The record should survive.

Public protocol specifications and test data should remain public and discoverable, even after a feed is retired.

02 Best Practices

Code quality is non-negotiable.

Source code in the OMI ecosystem follows automated builds, regression testing, clean code, and SOLID principles.

Contribute

Need a protocol added?

Send us the spec and any pcap captures you have (pcaps are optional). We'll add it to the Directory and generate the corresponding Wireshark dissector, C structs, C# classes, and Java classes.

requests@openmarketsinitiative.com

01

Send us the spec

Share the exchange's published specification — XML, FIX, PDF, or a link to their docs.

02

Include pcaps if you have them

Packet captures speed up validation but are never required to submit a request.

03

We handle the rest

We normalize, compile, and publish it to the Directory with all four output targets generated.

OMI is open source, built with the community.

Everything OMI produces is free, MIT-licensed, and community-driven. Browse the full catalogue, contribute a protocol, or just start building.
